The invention relates to a rock drilling machine of the kind stated in the preamble of claim 1.

The object of the invention is to provide a new and improved rock drilling machine where the axial contact surfaces between the pistons continuously have a good lubrication achieved by means of the pressure fluid, which enables prevention of wear of the contact surfaces. In addition, the pressure fluid may serve as a sufficiently damper between the contact surfaces. A further advantage is that one pressure medium can be fed to the axial bearing from one pressure source, resulting in a small number of ducts and a simple structure.

According to the invention, this is achieved by that the same pressure fluid fed to the axial bearing is arranged to act on said piston contact surfaces and pressure surfaces.

The documents cited in the International Search Report represent background art.

The inventions defined in claims 1-12 are not disclosed by any of these documents.
